

Dry Beans

Record Yields Temper Production Decline

The first estimate of the 2008 dry bean crop indicated a 5-percent reduction from a year earlier (table 15). This was a little better than initially projected due to a second consecutive year of above average yields. However, in order to attain these projected yields, some growing areas will require the cooperation of Mother Nature. Although harvest had begun in the Northwest, crop maturity was a week or so later than average in other growing regions. As a result, some growers may need a late summer and early fall devoid of frost and heavy rain to get a quality crop into the bin. The initial crop estimate indicated national yields in 2008 could average 17.86 cwt per acre—4 percent above a year earlier and, if realized, would be a record high (figure 10). Record-high yields are projected for North Dakota and Wyoming. New York expects its best yields of the past 5 years, while Wisconsin may see its first increase in dry bean yields since the 2004 record high.

Table 15--U.S. dry beans: Production, 2005-2008

Item	2005	2006	2007	2008 p	Percent change
	--1,000 cwt--				Percent

U.S. dry bean growers ultimately reduced planted area 8 percent due mostly to strong competition with other field crops. As a result, estimated area available for harvest is also forecast to decline 8 percent to 1.35 million acres. In 11 of the 18 surveyed States harvested area was expected to be down. North Dakota, which accounted for 42 percent of U.S. dry bean seeded area (down from 45 percent in 2007), expects to harvest 14 percent fewer acres in 2008, with increases in navy and black beans being outweighed by declining pinto, garbanzo, and pink bean area. Harvested area in Michigan, the second-leading producing State, is expected to drop 5 percent in 2008, with reduced acreage for black and light-red kidney beans outweighing increases in navy and small red beans.

With lower acreage outweighing strong yields, production is expected to decline in 11 of the 18 States included in the USDA dry bean survey. The largest reductions are expected in Washington, California, and North Dakota. If realized, the 2008 North Dakota dry bean crop would be the fourth largest on record and comes after last year's sizeable output—the second-largest on record. Growers in Michigan, the second-leading producer, initially anticipated below-average yields due to excessive rain early in the growing season. However, crop conditions have improved somewhat in the State since the August estimate was released. Thus, with good fall weather, yields could improve enough to push Michigan's production above last year's level.

Because harvested area and yield are moving in opposite directions this year, making an early estimate on which classes will see larger production and which will decline is a bit tenuous. Based on planted area estimates released in August (table 16) and yield patterns in major States, it appears that production could be lower for about half of the of the estimated classes including pinto, black, garbanzo, baby lima, blackeye, cranberry, and pink beans—with the majority of the decline in pintos. Increased output is expected for navy, Great Northern, dark red kidney, large lima, small red, and miscellaneous beans—classes which account for about a third of the U.S. dry bean crop. USDA will release the first official estimate of production by class in the December 11 *Crop Production* report.

Prices Higher in 2007/08, Likely To Stay Strong in 2008/09

During the first 11 months of 2007/08, grower prices across all classes of dry beans averaged \$30.67—31 percent above a year ago. With the exception of California, grower prices averaged above a year earlier in every major dry bean State. The greatest year-over-year increase was in Michigan, where September-July prices averaged 59 percent higher to \$35.99 per cwt. The next closest state was Nebraska where grower prices averaged 42 percent above a year earlier through July. In Michigan, the market has been supported mostly by strong navy bean and kidney bean prices, while Great Northern and pinto bean prices have given Nebraska's dry bean market a boost.

For the most part, dry bean prices over the next year are expected to remain relatively strong given the annual hand-to-mouth nature of the current market. Prices will likely remain under pressure given limited stock buffers for most classes, steady domestic demand, strong export demand, and the need to remain competitive with alternative field crops. During the 2008/09 season, prices and per-acre returns for the major field crops (wheat, corn, soybeans) are expected to average above those of the previous year. This will also play a role in the dry bean market as prices will need to be competitive early next year when growers are making their cropping decisions. The current price outlook for the 2009/10 season is less certain, but with world stocks of many field crops improving, some weakening of average prices (back to the 2007/08 averages) is projected.

During June and July of 2008, the Producer Price Index for canned dry beans began to reflect higher ingredient costs, rising 6 percent from a year earlier after remaining largely unchanged over the first 5 months of the year. During June and July of 2008, the retail price for dry packaged beans averaged 21 percent above a year earlier and 11 percent above the average of the first 5 months of the year. In July, consumers paid an average of \$1.23 per pound for packaged dry beans, up 2 percent from June, but up 27 percent from a year ago and 47 percent above 2 years ago.

Export Volume Strong

Continued food aid demand plus the moderating effect of the weaker U.S. dollar on high domestic dry bean prices helped push the volume of dry bean exports up 22 percent from a year ago over first 10 months of 2007/08 (September-June).

Limited world supplies plus the weaker dollar helped support gains in exports for several bean classes (table 17). Shipment volume has risen despite higher prices—unit export value increased 14 percent to 32.8 cents per pound through June.

While export movement improved to Canada (up 40 percent) and the Dominican Republic (up 50 percent), less volume was shipped to Mexico (down 18 percent), Japan (down 4 percent), and Haiti (down 5 percent). Export sales to the United Kingdom increased 53 percent, led by navy and dark red kidney beans. Greater volume was also shipped to Italy, Turkey (largely Great Northern), India, and Zimbabwe (largely pinto and dark red kidney).

In calendar 2007, the United States exported about 17 percent of its dry bean supplies (production, stocks, and imports), compared with 20 percent a year earlier. During the first 6 months of 2008, despite dwindling supplies and higher prices stemming from last year's modest crop, export movement was strong. Even if the current pace were to slow through the end of the year, U.S. dry bean export volume would likely still be the largest this decade and the greatest since 1998.

-- not available. p = preliminary based on average weekly prices.

1/ Average price received by U.S. growers as reported by USDA, NASS. Annual is season-average. 2/ Mid-point of range quoted in Minnesota/N. Dakota.

3/ Mid-point of range quoted in Michigan. 4/ Mid-point of range quoted in Colorado/Nebraska/Wyoming.

5/ Mid-point of range quoted in Minnesota/Wisconsin. 6/ Mid-point of range quoted in Idaho.

7/ Mid-point of range quoted in California. 8/ Mid-point of range quoted in Idaho/Washington.

f = ERS forecast. Totals may not sum due to rounding. 1/ Per capita disappearance reflects domestic production, net trade, and estimated change in stocks.

2/ Includes small white and all other dry edible beans after 1979.
